

Overview	<p>Students will begin their final GCSE year by continuing their work on natural hazards, looking more locally at UK weather hazards, and why the UK weather is so variable. They will also gain an appreciation for how extreme weather impacts the UK, and how this has been managed in the past. They will then go on to look at the changing economic world, and look more depth at how countries and their very different contexts have differing economic development. They will also gain more understanding of how strategies such as aid and fairtrade aim to reduce the development gap, before applying their understanding to the UK by looking at how the UK's economy has changed over time. Students will then look at their final unit of content by focussing on resource management of water energy and food. They will look at how these are distributed and managed in the UK before focussing on water management around the world, including examples of water management schemes. In year 11 students will also develop their geographical skills by applying their understanding to two geographical enquiries, including an opportunity to experience first hand fieldwork. They will also apply their knowledge and understanding to a current geographical issue in the world, and form their opinion on this issue.</p>
